Security Policies, Standards & Guidelines

Regulatory	Required by law and industrial standards							
Advisory	Not compulsory, but advisable							
Informative	As guidance to others							
Information Policy	Define best practices for information handling and usage -Security policies: Technical details of the policies i.e. SYSTEM security policy: lists hardware / software in use and steps for using policies							
Standards	Define usage levels							
Guidelines	Non-compulsory standards							
Procedures	Steps for carrying out tasls and policies							
Baseline	Minimum level of security							

Standards						
NIST	National Institute of Standards Technology					
NIST SP 800 Series	Computer security in a variety of areas					
800-14 NIST SP	Securing Information Technology systems					
800-18 NIST	Develop security plans					
800-27 NIST SP	Baseline for achieving security					
800-88 NIST	Guidelines for sanitation and disposition, prevents data remanence					
800-137	Continuous monitoring program: define, establish, implement, analyze and report					
800-145	Cloud computing standards					
FIPS	Federal Information Processing Standards

False Acceptance	The percentage invalid users that will be falsely accepted.	. common contro		organization's	cards, and passwords.		on / Composition	Combination of two unmatching
Rate (FAR) Crossover Error	Type 2 error. The point at which FRR equals FAR. This is expressed as	Physical Control		cture and	Perimeter security, biometrics and cabling.		sswords use Passwords	Requires that a long phrase be used.
Rate (CER)	a percentage - lower CER is better.	Proced	ure for u	user account	t management	One-Time or D	ynamic Passwords	Passwords that are valid for a single session login.
	Order of effectiveness and accuracy: Iris Scan • Retina						owarda (CADCHA)	Uses of character images or graphics

Regular user account review and password changes, track access authorization

using a procedure, regularly verify the accounts for active status.

Uses of character images or graphics

A password that only uses numbers. $\,$

as a part of the authentication.

Graphical Passwords (CAPCHA)

Numeric Passwords

Scan • Fingerprint • Hand Geometry • Voice Pattern • Keystroke Pattern • Signature Dynamics.

Biometric scans

:	Software Testing
Static Testing	Test code passively without running the code: syntax checking, code reviews & walkthroughs. Eg. tools that use exploitable buffer overflows from open source code
Dynamic Testing	Analyze and test using running environment. Use to test software provided by third parties where no access to software code. Eg. cross-site scripting, SQL injection
Fuzz Testing	Type of dynamic testing which use specific inputs to detect flaws under stress/load. Eg. input invalid parameters to test
Mutation / Dumb Fuzzing	Using already modified input values to test.
Generational / Intelligent Fuzzing	Inputs models of expected inputs.
Misuse Case Testing	Evaluate the vulnerability of known risks and attacks.
Interface Testing	Evaluate performance of software modules against the interface specifications to validate working status.
Application Programming Interfaces (APIs)	Test APIs to verify web application meets all security requirements.
User Interfaces (UIs)	Includes graphic user interfaces (GUIs) and command-line interfaces (CLI). Review of user interfaces against requirement specifications.
Physical Interfaces	Eg. in physical machines such as ATM, card readers etc.
Unit Testing	Testing a small part of the system to test units are good for integration into final product.
Integration Level Testing	Transfer of data and control between program interfaces.
System Level Testing	Verify system has all the required specifications and functions.

Log Management System			
OPSEC process	Analyze daily operations and review possible attacks to apply countermeasures.		
Pen-test	Testing of network security in view of a hacker.		
Port scanner	Check any port or port range open in a computer.		
Ring zero	Internal code of the system.		
Operational assurance	Verify software meets security requirements.		
Supervisor mode	Processes running in internal protected ring.		

Supervisor mode	Processes running in internal protected ring.			
Threat Assessment Modeling				
STRIDE	Evaluate threats against applications or operating systems.			
Spoofing	Use of false identity to gain access to system identity. Can use IP/ MAC address, usernames, wireless network SSIDs.			
Tampering	Cause unauthorized modifications of data in transit or in storage. Results in violation of integrity as well as availability.			
Repudiation	Deny an action or activity carried out by an attacker.			
Information disclosure	Distribution of private/confidential or restricted information to unauthorized parties.			
Elevation of privilege	Attack result in increase the level privileges for a limited user account.			
Regular monitoring of key performance and risk indicators including	Number of open vulnerabilities and compromised accounts, vulnerability resolve time, number of detected software flaws etc.			
Vulnerability scans	Automatically probe systems, applications, and networks.			
TCP SYN Scanning	Sends a packet with SYN flag set. Also known as "half-open" scanning.			
TCP Connect Scanning	Perform when a user running the scan does not have the			

necessary permissions to run a half-open scan.

Sends a packet with the FIN, PSH, and URG flags set.

Detect rogue scanning devices in wireless networks.

Read-only account to access configuration files.

Sends a packet with the ACK flag set.

TCP ACK Scanning

Xmas Scanning

Passive Scanning

Authenticated scans

Software Development Security Best Practices

	,
WASC	Web Application Security Consortium
OWASP	Open Web Application Security Project
BSI	the Build Security In initiative
IEC	The International Electrotechnical Commission

Security Testing

To make sure security controls are properly applied and in use. Automated scans, vulnerability assessments and manual testing.

Software	Threats
JULIWALE	i ili cats

Viruses	Stealth virus • Polymorphic virus • Macro virus • • Spyware/Adware • Botnet • worm
Rootkit	Kernel-mode Rootkit • Bootkit • User-mode Rootkit • Virtual Rootkit • Firmware Rootkit
Source Code Issues	Buffer Overflow • Escalation of Privileges • Backdoor
Malware Protection	Antivirus software • Antimalware software • Security Policies

Considerations

- Resources availability
- · Level of critical and sensitiveness of the system under testing
- Technical failures
- · Control misconfigurations result in security loopholes
- Security attack risks
- Risk of performance changes
- Impact on normal operations

Verification & Validation

- Verification SDLC design output meets requirements
- · Validation Test to ensure software meets requirements

Security Software

- Antimalware and Antivirus Scan and log malware and virus detection
- IDS/IPS = Real time and promiscuous monitoring for attacks
- Network-based IDS
- Local network monitoring and passive and header level scanning. No host level scan.
- HOST BASED
- Monitor hosts using event logs
- Intrusion prevention system (IPS) Attack detects and prevent
- Remote Access Software Should be access via a VPN
- Vulnerability assessment Software should be updated and patched
- Routers policy based access control

Network Flow Network traffic capture Audit logging Events related to hardware device login and access Network Time Protocol (NTP) Should synchronize across entire network to have correct and consistent time in logs and device traffic flows. Syslog Device event message log standard. Event types Errors, Warnings, Information, Success Audits, Failure Simple Network

Support for different devices such as Cisco.

Monitoring and auditing

Define a clipping level. A.K.A BASELINE

- Audit trails event/transaction date/time, author /owner of the event
 Availability Log archival
- Log Analysis examine logs

Integration Testing

Management Protocol (SNMP)

Configuration Management (CM)

An ITILv2 and an ITSM process that tracks all of the individual Configuration Items

	Incident Scene
•	ne scene • Incident environment protection • ID and possibl evidence • Collect evidence • Avoid or minimize evidence contamination
Locard's Exchange Principle	In a crime the suspected person leaves something and takes something. The leftovers can be used to identify the suspect.
	Live Evidence

	Live Evidence
Primary Evidence	 Most reliable and used by trial Original documents-Eg. Legal contracts No copies or duplicates

	No copies of dupilicates
′	 Less powerful and reliable than primary evidence. Eg. Copies of originals, witness oral evidence. If primary evidence is available secondary of the same content is not valid.
ice	Can prove without a backup support. • Eq. witness testimony by his/her own 5 senses

	Ly. Withess testimony by his/her own 5 senses.
Conclusive Evidence	 Cannot contradict, conditional evidence, no other supportive evidence requires Cannot be used to directly prove a fact
Corroborative	Use as substantiate for other evidence

· Something heard by the witness where another person told

Asset Management

Preserve Availability • Authorization and Integrity • Redundancy and Fault Tolerance •

Backup and Recovery Systems • Identity and Access Management

 Hierarchical Storage Management (HSM): continuous online backup system Using optical storage. Media History: Media usage log Media Labeling and Storage: safe store of media after labeling sequentially Environment: Temperature and heat Eg. Magnetic media

Data Purging: degaussing Archived data not usable for

 Data Clearing: Cannot recover using keyboard Remanence: Data left in media deleted · Redundant hardware Fault-tolerant technologies Service Level Agreements (SLA's) MTBF and MTTR

Changes should be formally requested

Cost and effort estimation before approval

Analyze requests against goals to ensure validity

 Single Point of Failure (SPOF) 1. Detect • 2. Respond • 3. Report • 4. Recover • 5. Remediate • 6. Review

 Identify the change steps after approval · Incremental testing during implementation Complete documentation Clipping levels: Define a baseline for normal user errors, Modification from Standards Eg. DDOS

 Unusual patterns or events Unscheduled reboots: Eg. Hardware or operating system issue Input/output Controls

Automated inspection of logs and real-time system events IDS (Intrusion to detect intrusion attempts and system failures. IDSs are an Detection System) effective method of detecting many DoS and DDoS attacks.

Intrusion Detection & Prevention Systems (IDS &

IPS (Intrusion Prevention System)	A IDS with additional caabilities to stop intrusions.
	Firewalls

including its network connection points. Eg. Mainframe computer

Hardware based device or software applications used to monitor and analyse network activity, specifically scanning for malicious activities and policy violations.

Monitor and analyze the internals of a computing system,

Types of System Failure **Hierarchical Recovery** Types System reboot

Use after initial use

- System cold start

Data Destruction and Reuse

Disaster Recovery Planning						
	Complete destruction, preferably by burning					
	Degaussing or overwriting to be removed					

Teams responsible for DR implementation - Salvage team - Work

on normal /primary site to make suitable for normal operation
Interfacing with other groupsFraud and Crime: Eg. vandalism, looting

· Documenting the Plan - Required documentation

Activation and recovery procedures

· Internal /external communications

Detailed plans by team members

. ~			
ıg			

	1				
Relevant	Reasonable facts, with proof of crimes, acts and methods used, event documentation				
Permissible	Evidence obtained lawfully				
Interviewing and Interrogation					
Interviewing	Collect facts to determine matters of the incident.				
	Obtain a confession by evidence retrieval method.				

Characteristics of Evidence

Consistent facts. Evidence not tampered or modified

Validity can be acceptable.

Sufficient

Reliable

Expert

Witnesses

The 3 Branches of Law

(UCITA)

Redundant servers

Desk Check

Simulation test

tests

strategy

• The Process: Prepare questions and topics, summarize information Opinion Rule | Witnesses test only the facts of the case, not used as evidence. Can be used as evidence.

Network Analysis Use of existing controls to inspect a security breach incident. Eg. IDS/IPS, firewall Software Analysis: Forensic investigation of applications which was running while

the incident happened. • Hardware/ Embedded Device Analysis: Eg. review of Personal computers & **Smartphones**

Governing Laws · Common law - USA, UK Australia, Canada

· Civil law - Europe, South America Islamic and other Religious laws – Middle East, Africa, Indonesia, USA Legislative: Statutory law - Make the laws

Juridical: Interpret the laws

Executive: Administrative law - Enforce the laws

 Criminal law –violate government laws result in commonly imprisonment Civil law – Wrong act against individual or organization which results in a damage or loss. Result in financial Categories of law Administrative/Regulatory law – how the industries, organizations and officers should act. Punishments can be imprisonment or financial penalties **Uniform Computer** Common framework for the conduct of computer-related Information business transactions. A federal law Eg. Use of software **Transactions Act**

Computer Crime Laws Unauthorized alteration or destruction 3 types of harm Malicious code · Relevant, sufficient, reliable, does not have to be Admissible evidence tangible · Second hand data not admissible in court Hearsay

Unauthorized intrusion

licensing

• Is the legal action of luring an intruder, like in a Enticement honeypot • Is the illegal act of inducing a crime, the individual had Entrapment no intent of committing the crime at first

Scans data for keywords and data patterns. Protects before an incident occurs. Network-bas Data in motion. Scans all outbound data looking for anomalies. Place

Data Loss Prevention (DLP)

in edge of the network to scan all outgoing data.

Endpoint-bas Data in use. Scans all internal end-user workstations, servers and ed DLP devices.

Digital Data States Data that is stored on a device or a backup medium. Data at Rest Data in Data that is currently travelling across a network or on a device's

Data that is being inputted, processed, used or altered. Data in Use **Backup Types** Full All files backed up, archive bit and modify bit will be deleted Incremental

RAM ready to be read, updated, or processed.

Backup files changed after last full backup, archive bit deleted. Only modified files are backed up, do not delete archive bit. Need last full backup and last incremental backup for a full restore.

Set of servers that process traffic simultaneously. Server clustering

Disaster Recovery Test

Review contents of the plan Disaster recovery team members gather and roleplay a Table-top exercise disaster scenario More intense than a roleplay, all support and tech staff meet

Eg. RAID, adding disks for increased fault tolerance.

Personnel are taken to an alternative site and commence Parallel tests operations of critical systems, while original site continues operating Full-implementation Personnel are taken to an alternative site and commence operations of all systems, main site is shut down

and practice against disaster simulations

BCP Plan Development

Define the continuity • Facilities: use of primary or alternate/remote site buildings People: operational and management

Roles and responsibilities departments CCTV · Fences-Small mesh and high gauge

• Audit trails: date and time stamps, successful/unsuccessful attempts, who attempted, who

	• Alarms
	• Intrusion detection: electromechanical, photoelectric, passive infrared, acoustical detection
	Motion: wave pattern motion detectors, proximity detector
Physical security	• Locks: warded lock, combination lock, cipher lock, device lock, preset / ordinary door lock, programmable

locks, raking lock

Supplies and equipment

 Computing: strategy to protect - hardware, software, communication links, applications, data • BCP committee: senior staff, business units, information systems, security administrator, officials from all anical, photoelectric, passive infrared, acoustical detection

Configuration

Version: state of the CI, Configuration - collection of component Items (CI) Cl's that makes another Cl Assembling a component with component CI's Build list Building Recovery procedures. Eg. system restart. Should be accessed **Artifacts**

by authorized users from authorized terminals. **Incident Response**

Recovery • Feedback Mitigation Limit the impact of an incident.

first.

downtime.

Root Cause Analysis (RCA)

Response Capability • Incident response and handling •

Looks at the predominant likely causes to deal with them

A real-time mirror of your system and network activity

An alternative workspace with power and HVAC setup, but

no hardware. All recovery efforts will be technician heavy.

software and connectivity to restore critical functionality.

Contract with a service bureau to provide backup services.

A middle-ground solution which includes skeletal hardware,

running in sync. Allows for minimum disruption and

Fault tree analysis (FTA) Top down deductive failure analysis using boolean logic. Review of as many components, assemblies, and Failure mode and subsystems as possible to identify potential failure effects analysis (FMEA)
